

Metadata abstract for the Fergusson Long-term Vegetation Monitoring project**Prepared by:** Ashish N. Nerlekar (ashishnerlekar3@gmail.com)**Investigators:** Ashish N. Nerlekar, Snehangshu Das, Akshay A. Onkar, Mayur Bhagwat, Pranav C. Mhaisalkar, Minakshi C. Mahajan.**Start and end Dates:** 18th May 2018 (Botanical Garden), 17th June 2018 (Central garden), 21-23 June 2018 (Long-term transects)**Objectives:** To understand changes in the structural and functional composition of woody vegetation in the campus over time.**Key words:** Fergusson College, Pune, Long-term, city, trees, ecology**Locations:** The table below gives locations of all the 50 permanent transects along with locations of the two gardens.

Transect code	Start GPS	End GPS	Transect code	Start GPS	End GPS

Fergusson College Central Garden:		18.523251; 73.839009			

Methods:

1. For Long-term transects:

We established and monitored 50 vegetation transects, each of 10m x 2m in the Fergusson College campus, Pune. All trees in the transects have been marked with yellow oil paint (one stem per individual marked). The botanical identity of all woody species with a diameter greater than 1cm at 1.3 m height above ground was recorded, along with their girth and height. All plant groups including Palms, Cycads, woody Pteridophytes, Bamboos and Lianas were included along with non-woody groups (eg. *Dracaena* spp., *Musa* spp.). A 10 m long nylon rope was stretched from the first tree in the specified direction to ascertain the transect boundaries and a width of 1m was considered on both the sides. For the botanical identification, Ingalhalikar and Barve (2010) and Nerlekar et al. (2016) were primarily followed. The girth was measured using a Freeman's measuring tape to the nearest millimetre. It should be noted that the steel end denotes zero for the tape. Height was visually estimated. For multi-stemmed trees, all girths were recorded separately in the data sheet. Dead trees (standing) were also included in the enumeration. A photograph of the transect was clicked using a DSLR camera in the wide angle mode, standing behind the starting tree, so as to include first tree, 10m nylon rope with all trees in between preferably visible.

2. For Garden census:

We undertook a census for the two gardens (The Botanical garden and the Central garden of the Fergusson College, Pune). All woody plant species including Palms, Cycads, woody Pteridophytes, Bamboos and Lianas were included, but non-woody groups (eg. *Dracaena*

spp. and non-woody vines (eg. *Vallaris solanacea*, *Vitis quadrangularis*) along with *Bougainvillea* spp. were excluded. All woody plants greater than 1cm diameter (at 1.3m height above ground) were identified, their girth and height measured. The methods for enumeration are similar to those for the Long-term transects. Some plants were re-visited to confirm their botanical identity.

File and sheet descriptions:

Sheet 1) ‘Long term transects’: Includes data for the 50 Long-term transects established and monitored. ‘Date’ is in the DD-MM-YYYY format. ‘Team’ has names of investigators present for the sampling. ‘Transect name’, which is usually based on an area, a peculiar tree, or an object is given so that new investigators can easily locate transects without a GPS unit. ‘Transect number’ ranges from 1 to 50 and denotes the respective transect codes. The ‘Species’ column provides scientific names of all species encountered including dead and unidentified ones. The columns ‘GBH 1 (cm)’ to ‘GBH 12 (cm)’ provide measurements in centimetre for single or multi-stemmed trees. ‘Height’ column provides an approximate height in meters. Note that this is a coarse visual estimate. ‘Remarks’ has any useful information and also presence of saplings that are less than 1.3m height. ‘Transect landmarks’ have remarks that list peculiar objects in or near transects so as to easily locate it.

Sheet 2) ‘FCBG census’: Includes data for the census of the Fergusson College Botanical Garden (FCBG). All fields mentioned in Sheet 1 that appear here again, have the same description. For trees with stems more than 12 (eg. Bamboos, *Adhatoda vasica*), stems with same GBH have been pooled and written for the sake of convenience. Note that for calculating total basal area, using this pooled girth is erroneous and basal area must be calculated for each stem separately. The data sheet hard copies can be referred for obtaining information on number of stems of each GBH class. ‘Tag number’ refers to the maroon tags that were attached to trees during the survey of Dr. M. C. Mahajan during 2006-07.

Sheet 3) ‘Central garden census’: Includes data for the census of the Fergusson College Central Garden. All fields mentioned in Sheet 1 and 2 that appear here again, have the same description. The ‘Section’ column refers to the four sections of the garden that are created due to pavements. These four sections have been given names based on prominent trees or buildings so that a section-wise comparison is possible if necessary at a later stage.
